NEW QUESTION: 2

次の脅威の種類のが、通常の処理の一部としてそのコードを実行させようとして、アプリケーションの入力フィールドを介してコマンドまたは任意のデータを送信することを含みますか？

- A. クロスサイト偽造
- B. クロスサイトスクリプティング
- C. 注射
- D. 関数レベルのアクセス制御がありません

Answer: C

Explanation:

An injection attack is where a malicious actor will send commands or other arbitrary data through input and data fields with the intent of having the application or system execute the code as part of its normal processing and queries. This can trick an application into exposing data that is not intended or authorized to be exposed, or it could potentially allow an attacker to gain insight into configurations or security controls. Missing function-level access control exists where an application only checks for authorization during the initial login process and does not further validate with each function call. Cross-site request forgery occurs when an attack forces an authenticated user to send forged requests to an application running under their own access and credentials. Cross-site scripting occurs when an attacker is able to send untrusted data to a user's browser without going through validation processes.
