### NEW QUESTION: 1

In what situation must spanning-tree be implemented?

- A. when first hop redundancy protocol exists with redundant Layer 2 links between distribution switches
- B. when it is necessary to speed up network convergence in case of link failure
- C. when a VLAN spans access layer switches to support business applications
- D. when trunks need to extend multiple VLANs across access switches

**Answer: A**

### NEW QUESTION: 2

- A. Option A
- B. Option D
- C. Option B
- D. Option C

**Answer: D**

Explanation:

Explanation

The below diagram shows how this can be done

- 1) First create a new ELB which will be used to point to the new production changes.
  - 2) Use the Weighted Route policy for Route53 to distribute the traffic to the 2 ELB's based on a 80-20% traffic scenario. This is the normal case, the % can be changed based on the requirement.
  - 3) Finally when all changes have been tested, Route53 can be set to 100% for the new ELB.
- Option A is incorrect because this is a failover scenario and cannot be used for Blue green deployments. In Blue Green deployments, you need to have 2 environments running side by side.
- Option B is incorrect, because you need to have a production stack with the changes which will run side by side.
- Option D is incorrect because this is not a blue green deployment scenario. You cannot control which users will go the new EC2 instances.
- For more information on blue green deployments, please refer to the below document link:
