-- Exhibit --

Click the Exhibit button.

All four routers in the exhibit are in the same broadcast domain. The routers were powered on at the same time.

Based on the configurations, which devices are the DR and the BDR?

- A. R3 is the DR and R2 is the BDR.
- B. R2 is the DR and R1 is the BDR.
- C. R4 is the DR and R2 is the BDR.
- D. R2 is the DR and R3 is the BDR.

Answer: D

NEW QUESTION: 2

What problem may exist for a multiple channel architecture(MCA) WLAN when its APs are all operating at full power (typically 100mW)?

- A. The mismatched power between WLAN client stations and APs violates regulatory and IEEE signal quality requirements.
- B. Cell size may be too large, causing co-channel interference to adjacent cells and reducing system capacity.
- C. APs operating in the 2.4 GHz band would prevent microwave ovens and analog video cameras from functioning.
- D. WLAN client stations can experience the hidden node problem when located near each other within the same cell.

Answer: D

NEW QUESTION: 3

Note: This question is part of a series of questions that present the same scenario. Each question in the series contains a unique solution that might meet the stated goals. Some question sets might have more than one correct solution, while others might not have a correct solution.

After you answer a question in this scenario, you will NOT be able to return to it. As a result, these questions will not appear in the review screen.

You plan to create an Azure Databricks workspace that has a tiered structure. The workspace will contain the following three workloads:

- * A workload for data engineers who will use Python and SQL
 - * A workload for jobs that will run notebooks that use Python, Spark, Scala, and SQL
 - * A workload that data scientists will use to perform ad hoc analysis in Scala and R
- The enterprise architecture team at your company identifies the following standards for Databricks environments:
- * The data engineers must share a cluster.
 - * The job cluster will be managed by using a request process whereby data scientists and data engineers provide packaged notebooks for deployment to the cluster.
 - * All the data scientists must be assigned their own cluster that terminates automatically after 120 minutes of inactivity. Currently, there are three data scientists.

You need to create the Databrick clusters for the workloads.

Solution: You create a High Concurrency cluster for each data scientist, a High Concurrency cluster for the data engineers, and a Standard cluster for the jobs.

Does this meet the goal?

A. Yes

B. No

Answer: B

Explanation:

No need for a High Concurrency cluster for each data scientist.

Standard clusters are recommended for a single user. Standard can run workloads developed in any language: Python, R, Scala, and SQL.

A high concurrency cluster is a managed cloud resource. The key benefits of high concurrency clusters are that they provide Apache Spark-native fine-grained sharing for maximum resource utilization and minimum query latencies.

NEW QUESTION: 4

A disaster causes a FlexGroup volume to be unrecoverable, but it was protected by a SnapMirror relationship.

You solve the issue, and the source is operational. Now, you want to return to serving the data from the original source.

In this scenario, what do you do next?

A. Initialize the SnapMirror relationship.

B. Perform a SnapMirror update.

C. Restore data from a backup copy.

D. Delete the SnapMirror relationship.

Answer: A
