NEW QUESTION: 2

DRAG DROP

You plan to deploy SQL Server 2016.

You identify the following security requirements for the deployment:

- * Users must be prevented from intercepting and reading the T-SQL statements sent from the clients to the database engine.
- * All database files and log files must be encrypted if the files are moved to another disk on another server.

You need to identify which feature meets each security requirement. The solution must minimize processor overhead.

Which features should you identify?

To answer, drag the appropriate feature to the correct requirement in the answer area.

Answer:

Explanation:

Explanation:

* Secure Sockets Layer (SSL) encryption enables transmitting encrypted data across the network between an instance of SQL Server and a client application.

* Transparent data encryption (TDE) performs real-time I/O encryption and decryption of the data and log files.

NEW QUESTION: 3

Refer to the exhibit.

The network associate is configuring OSPF on the Core router. All the connections to the branches should be participating in OSPF. The link to the ISP should NOT participate in OSPF and should only be advertised as the default

route. What set of commands will properly configure the Core router?

A. Core(config-router)# default-information originate

Core(config-router)# network 10.10.2.16 0.0.0.15 area 0

Core(config-router)# exit

Core(config)# ip route 0.0.0.0 0.0.0.0 10.10.2.14

B. Core(config-router)# default-information originate

Core(config-router)# network 10.10.2.32 0.0.0.31 area 0

Core(config-router)# exit

Core(config)# ip route 0.0.0.0 0.0.0.0 10.10.2.14

C. Core(config-router)# default-information originate

Core(config-router)# network 10.0.0.0 0.255.255.255 area 0

Core(config-router)# exit

Core(config)# ip route 0.0.0.0 0.0.0.0 10.10.2.14

D. Core(config-router)# default-information originate

Core(config-router)# network 10.10.2.13 0.0.0.242 area 0

Core(config-router)# exit

Core(config)# ip route 0.0.0.0 0.0.0.0 10.10.2.14

Answer: A

Explanation:

There are two ways to inject a default route into a normal area.

1. If the ASBR already has the default route in its routing table, you can advertise the existing 0.0.0.0/0 into the OSPF domain with the default-information originate router configuration command.

2. If the ASBR doesn't have a default route, you can add the keyword always to the default-information originate command (default-information originate always).

This command will advertise a default route into the OSPF domain, regardless of whether it has a route to 0.0.0.0.

Another benefit of adding always keyword is that it can add stability to the internetwork. For example, if the ASBR is learning a default route from another routing domain such as RIP and this route is flapping, then without the always

keyword, each time the route flaps, the ASBR will send a new Type 5 LSA into the OSPF domain causing some instability inside the OSPF domain. With the always keyword, the ASBR will advertise the default inside the OSPF domain always,
In the example shown here, only choice C is correct as the wildcard mask correctly specifies the 10.10.2.16 0.0.0.15 networks, which include all IP addresses in the 10.10.2.16-10.10.2.31 range. In this question we were told that the ISP link should NOT be configured for OSPF, making choice A incorrect.
