Answer: C

NEW QUESTION: 2
Refer to the exhibit.

You are planning the design of an encrypted WAN. IP packets will be transferred over encrypted GRE tunnels between routers B and C.
The packet size is limited to a maximum of 1500 bytes inside the WAN between routers B and C.
If endpoint 1 tries to send 1500byte IP packets to endpoint 2, in what three ways will the network design handle the fragmentation in three different possible network configurations? (Choose three.)
A. When router B fragments packets after the encryption, the endpoint 2 must reassemble these fragmented packets.
B. When router B fragments packets before the encryption, endpoint 2 must reassemble these fragmented packets.
C. When router A fragments packets, router C must reassemble these fragmented packets.
D. When router B fragments packets before the encryption, router C must reassemble these fragmented packets.
E. When router B fragments packets after the encryption, router C must reassemble these fragmented packets.
F. When router A fragments packets, endpoint 2 must reassemble these fragmented packets.

NEW QUESTION: 4
Note: This question is part of a series of questions that use the same scenario. For your convenience, the scenario is repeated in each question. Each question presents a different goal and answer choices, but the text of the scenario is exactly the same in each question in this series.
You are a database administrator for a company that has an on-premises Microsoft SQL Server environment and Microsoft Azure SQL Database instances. The environment hosts several customer databases, and each customer uses a dedicated instance. The environments that you manage are shown in the following table.

You need to monitor WingDB and gather information for troubleshooting issues.
What should you use?
A. sys.dm_os_waiting_tasks
B. sp_updatestats
C. sp_lock
D. sys.dm_tran_active_snapshot_database_transactions
E. Activity Monitor
Answer: C
Explanation:
Explanation
The sp_lock system stored procedure is packaged with SQL Server and will give you insight into the locks that are happening on your system. This procedure returns much of its information from the syslock info in the master database, which is a system table that contains information on all granted, converting, and waiting lock requests.
Note: sp_lock will be removed in a future version of Microsoft SQL Server. Avoid using this feature in new development work, and plan to modify applications that currently use this feature. To obtain information about locks in the SQL Server Database Engine, use the sys.dm_tran_locks dynamic management view.
sys.dm_tran_locks returns information about currently active lock manager resources in SQL Server 2008and later. Each row represents a currently active request to the lock manager for a lock that has been granted or is waiting to be granted.
