NEW QUESTION: 1

Oracle Cloud Infrastructure Container Engine for

KubernetesにPythonアプリケーションをデプロイしました。ただし、テスト中にバグを見つけて修正し、新しいDockerイメージを作成しました。この新しいイメージが機能しない場合は、前のバージョンにロールバックできることを確認する必要があります。

kubectlを使用して、どのデプロイ戦略を選択する必要がありますか？

- A. Rolling Update
- B. A/B Testing
- C. Canary Deployment
- D. Blue/Green Deployment

Answer: D

Explanation:

Explanation

Using Blue-Green Deployment to Reduce Downtime and Risk:

>Blue-green deployment is a technique that reduces downtime and risk by running two identical production environments called Blue and Green. At any time, only one of the environments is live, with the live environment serving all production traffic. For this example, Blue is currently live and Green is idle.

This technique can eliminate downtime due to app deployment. In addition, blue-green deployment reduces risk: if something unexpected happens with your new version on Green, you can immediately roll back to the last version by switching back to Blue.

>Canary deployments are a pattern for rolling out releases to a subset of users or servers. The idea is to first deploy the change to a small subset of servers, test it, and then roll the change out to the rest of the servers.

The canary deployment serves as an early warning indicator with less impact on downtime: if the canary deployment fails, the rest of the servers aren't impacted.

>A/B testing is a way to compare two versions of a single variable, typically by testing a subject's response to variant A against variant B, and determining which of the two variants is more effective

>Rolling update offers a way to deploy the new version of your application gradually across

your cluster.
