Configure Request Manager in SharePoint Server 2013 Request Manager is functionality in

SharePoint Server 2013 that enables administrators to manage incoming requests and determine how SharePoint Server 2013 routes these requests.

The front-end web server filtering process follows these steps:

- The routing pool is either the current front-end web server or one or more front-end web servers that request routing selects.
- All matching rules are checked to find the smallest health threshold value.
- Remove front-end web servers in the routing pool that have health scores greater than or equal to the smallest health threshold value.

## **NEW QUESTION: 4**

Lab Simulation

Wireless network users recently began experiencing speed and performance issues after access point 2 (AP2) was replaced due to faulty hardware.

The original network was installed according to a consultant's specifications and has always worked without a problem.

You, a network technician, have been tasked with evaluating the situation and resolving the issues to improve both performance and connectivity.

Refer to the following diagram and perform any NECESSARY changes to the wireless and wired infrastructure by adjusting devices.

Note: Adjust the LEAST number of devices needed to fix the issue, all blue icons in the image are clickable.

When you feel the simulation is complete please select the Done button.

## **Answer:**

Explanation:

- Change the speed and duplex settings on AP2 only to 100 and full.
- Change the mode to G on AP2
- Change the channel to 6 on AP2

Explanation:

Since we know that the network was running perfectly before replacing AP2 we should start by looking at this new device that was used to replace the old one. Here we see that the other AP's have hard coded the speed and duplex settings to 100/full, while AP2 is set to auto/auto.

Also, the other AP's have been configured to use 802.11G, while AP2 is using 802.11B.

Finally the channel that AP2 is using overlaps with AP1 which can cause problems.

Channels 1, 6, and 11 are spaced far enough apart that they don't overlap.

On a non-MIMO setup (i.e. 802.11 a, b, or g) you should always try to use channel 1, 6, or 11.

Since AP1 is using 1, and AP3 is using 11, AP2 should be using 6.
