Answer: D

NEW QUESTION: 2
Jane, an IT security technician, needs to create a way to secure company mobile devices. Which of the following BEST meets this need?
A. Implement application patch management, antivirus, and locking cabinets.
B. Implement screen locks, device encryption, and remote wipe capabilities.
C. Implement voice encryption, pop-up blockers, and host-based firewalls.
D. Implement firewalls, network access control, and strong passwords.
Answer: B
Explanation:
Explanation/Reference:
Explanation:
Screen-lock is a security feature that requires the user to enter a password after a short period of inactivity before they can access the system again. This feature ensures that if your device is left unattended or is lost or stolen, it will be difficult for anyone else to access your data or applications.
Device encryption encrypts the data on the device. This feature ensures that the data on the device cannot be accessed in a useable form should the device be stolen.
Remote wipe is the process of deleting data on a device in the event that the device is stolen. This is performed over remote connections such as the mobile phone service or the internet connection and helps ensure that sensitive data is not accessed by unauthorized people.

NEW QUESTION: 3
Your network consists of a large hub-and-spoke Frame Relay network with a CIR of 56 kb/s for each spoke. Which statement about the selection of a dynamic protocol is true?
A. EIGRP would be appropriate, because you can manage how much bandwidth is consumed over the Frame Relay interface.
B. EIGRP would be appropriate, because the Frame Relay spokes could be segmented into their own areas.
C. EIGRP would be appropriate, because by default, queries are not propagated across the slow speed Frame Relay links.
D. EIGRP would be appropriate if LMI type ANSI is NOT used.
Answer: A
Explanation:
Explanation/Reference:
By default, EIGRP will limit itself to using no more than 50% of the interface bandwidth. The primary benefit of controlling EIGRP's bandwidth usage is to avoid losing EIGRP packets, which could occur when EIGRP generates data faster than the interface line can absorb it. This is of particular benefit on Frame Relay networks, where the access interface bandwidth and the PVC capacity may be very different.
