- A. Access is granted once authorized by Notes single sign-on
- B. Users gain access once authenticated
- C. Once authenticated with the IBM Domino server, user access is checked to determine the level of authorization

Answer: A

NEW QUESTION: 2

Which of the following can Pete, a security administrator, use to distribute the processing effort when generating hashes for a password cracking program?

- A. RAID
- B. Redundancy
- C. Virtualization
- D. Clustering

Answer: D

Explanation:

Anytime you connect multiple computers to work/act together as a single server, it is known as clustering. Clustered systems utilize parallel processing (improving performance and availability) and add redundancy.

Server clustering is used to provide failover capabilities / redundancy in addition to scalability as demand increases.

Incorrect Answers:

A. RAID, or redundant array of independent disks (RAID). RAID allows your existing servers to have more than one hard drive so that if the main hard drive fails, the system keeps functioning.

C. Both Clustering and Load Balancing are redundancy measures and in this question only Clustering is mentioned.

D. Virtualization is the foundation for cloud computing. You cannot have cloud computing without virtualization. It makes it possible by abstracting the hardware and making it available to the virtual machines. The abstraction is done through the use of a hypervisor, which can be either Type I (bare metal) or Type II (hosted).

NEW QUESTION: 3

Note: This question is part of a series of questions that present the same scenario. Each question in the series contains a unique solution that might meet the stated goals. Some question sets might have more than one correct solution, while others might not have a correct solution.

After you answer a question in this sections, you will NOT be able to return to it. As a result, these questions will not appear in the review screen.

You have a Microsoft Azure SQL database that has Blob Auditing configured.

You need to review the audit logs.

Solution: From Microsoft SQL Server Management Studio, you connect to the database, and then you execute the following statement.

Does this meet the goal?

A. No

B. Yes

Answer: A

Explanation:

The `fn_get_audit_file`, not `dm_db_audit_file`, the returns information from an audit file created by a server audit in SQL Server.

This example reads from a file that is named

`ShiraServer/MayaDB/SqlDbAuditing_Audit/2017-07-14/10_45_22_173_1.xel`:

```
SELECT * FROM sys.fn_get_audit_file
```

```
('https://mystorage.blob.core.windows.net/sqldbauditlogs/ShiraServer/MayaDB/SqlDbAuditin
```

```
g_Audit/2017-07-14/10_45_22_173_1.xel',default,default);
```

Note: Blob auditing logs are saved as a collection of blob files within a container named `sqldbauditlogs`.
