#### **NEW QUESTION: 4**

개발자는 Amazon DynamoDB 테이블에서 수억 건의 제품 리뷰를 추적하는 애플리케이션을 개발 중입니다. 레코드에는 표에 표시된 데이터 요소가 포함됩니다.

파티션 키로 사용될 때 DynamoDB를 사용하여 가장 일관성있는 성능을 발휘하는 필드는 무엇입니까?

- A. 의견
- B. productID
- C. reviewID
- D. starRating

**Answer: B**

Explanation:

Explanation

Refer AWS documentation - DynamoDB Design partition key

The partition key portion of a table's primary key determines the logical partitions in which a table's data is stored. This in turn affects the underlying physical partitions. Provisioned I/O capacity for the table is divided evenly among these physical partitions. Therefore a partition key design that doesn't distribute I/O requests evenly can create "hot" partitions that result in throttling and use your provisioned I/O capacity inefficiently.

The optimal usage of a table's provisioned throughput depends not only on the workload patterns of individual items, but also on the partition-key design. This doesn't mean that you must access all partition key values to achieve an efficient throughput level, or even that the percentage of accessed partition key values must be high. It does mean that the more distinct partition key values that your workload accesses, the more those requests will be spread across the partitioned space. In general, you will use your provisioned throughput more efficiently as the ratio of partition key values accessed to the total number of partition key values increases.
