Explanation

VLAN hopping is a computer security exploit, a method of attacking networked resources on a virtual LAN (VLAN). The basic concept behind all VLAN hopping attacks is for an attacking host on a VLAN to gain access to traffic on other VLANs that would normally not be accessible. There are two primary methods of VLAN hopping: switch spoofing and double tagging.

+ In a switch spoofing attack, an attacking host imitates a trunking switch by speaking the tagging and trunking protocols (e.g. Multiple VLAN Registration Protocol, IEEE 802.1Q, Dynamic Trunking Protocol) used in maintaining a VLAN. Traffic for multiple VLANs is then accessible to the attacking host.

+ In a double tagging attack, an attacking host connected on a 802.1q interface prepends two VLAN tags to packets that it transmits.

Double Tagging can only be exploited when switches use "Native VLANs". Ports with a specific access VLAN (the native VLAN) don't apply a VLAN tag when sending frames, allowing the attacker's fake VLAN tag to be read by the next switch. Double Tagging can be mitigated by either one of the following actions:

- + Simply do not put any hosts on VLAN 1 (The default VLAN). i.e., assign an access VLAN other than VLAN 1 to every access port
- + Change the native VLAN on all trunk ports to an unused VLAN ID.
- + Explicit tagging of the native VLAN on all trunk ports. Must be configured on all switches in network autonomy.
