### **NEW QUESTION: 1**

攻撃者が会社のVoIPシステムに対してDoSイベントを作成しようとしています。攻撃者はツールを使用して、多数のSIP

INVITEトラフィックでネットワークをあふれさせる。次のうちどれがそのような攻撃を妨げる可能性が最も低いでしょうか？

- A. すべてのSIP通信を強制的に暗号化する
- B. 音声トラフィックとデータトラフィックに別々のVLANを作成します
- C. ネットワークにIDS / IPSシステムをインストールする
- D. スイッチにQoSパラメータを実装します

**Answer: D**

Explanation:

Quality of service (QoS) is a mechanism that is designed to give priority to different applications, users, or data to provide a specific level of performance. It is often used in networks to prioritize certain types of network traffic. It is not designed to block traffic, per se, but to give certain types of traffic a lower or higher priority than others. This is least likely to counter a denial of service (DoS) attack.

Incorrect Answers:

A: Denial of Service (DoS) attacks web-based attacks that exploit flaws in the operating system, applications, services, or protocols. These attacks can be mitigated by means of firewalls, routers, and intrusion detection systems (IDSs) that detect DoS traffic, disabling echo replies on external systems, disabling broadcast features on border systems, blocking spoofed packets on the network, and proper patch management.

B: VoIP makes use of Session Initiation Protocol (SIP) and the attack is making use of SIP INVITE requests to initiate VoIP calls. Forcing SIP communication to be encrypted would reduce SIP INVITE requests.

C: Using virtual local area networks (VLANs), to segregate data traffic from voice traffic can drastically reduce the potential for attacks that utilize automated tools.
