**Answer: B,D**

### **NEW QUESTION: 4**

You've been brought in as solutions architect to assist an enterprise customer with their migration of an e-commerce platform to Amazon Virtual Private Cloud (VPC).

The previous architect has already deployed a 3-tier VPC.

The configuration is as follows:

VPC: vpc-2f8bc447

IGW: igw-2d8bc445

NACL: ad-208bc448

Subnets and Route Tables:

Web servers: subnet-258bc44d

Application servers: subnet-248bc44c

Database servers: subnet-9189c6f9

Route Tables:

rtb-218bc449

rtb-238bc44b

Associations:

subnet-258bc44d : rtb-218bc449

subnet-248bc44c : rtb-238bc44b

subnet-9189c6f9 : rtb-238bc44b

You are now ready to begin deploying EC2 instances into the VPC. Web servers must have direct access to the Internet. Application and database servers cannot have direct access to the Internet. Which configuration below will allow you the ability to remotely administer your application and database servers, as well as allow these servers to retrieve updates from the Internet?

**A.** Create a bastion and NAT instance in subnet-258bc44d, add a route from rtb-238bc44b to igw-2d8bc445, and a new NACL that allows access between subnet-258bc44d and subnet-248bc44c.

**B.** Create a bastion and NAT instance in subnet-248bc44c, and add a route from rtb-238bc44b to subnet-258bc44d.

**C.** Add a route from rtb-238bc44b to igw-2d8bc445 and add a bastion and NAT instance within subnet-248bc44c.

**D.** Create a bastion and NAT instance in subnet-258bc44d, and add a route from rtb-238bc44b to the NAT instance.

**Answer: D**

Explanation:

Create NAT instance in public subnet which is web server subnet (subnet-258bc44d) and add route (rtb-238bc44b) from private subnet (database subnet-9189c6f9) to the public NAT one to retrieve the updates.
