You have a database application that uses Microsoft SQL Server 2012. You have a query named Query1 that returns four columns from a frequently updated table that has a clustered index. Three of the columns are referenced in the WHERE clause of the query. The three columns are part of a non-clustered index. The fourth column is not referenced in the WHERE clause.

Users report that the application begins to run slowly. You determine that the root cause for the performance issue is Query1.

You need to optimize the statement.

What should you do?

**B.** Add an INCLUDE clause to the index.

**C.** Include a SET TRANSACTION ISOLATION LEVEL SNAPSHOT statement before you run the query.

**D.** Include a SET TRANSACTION ISOLATION LEVEL REPEATABLE READ statement before you run the query.

**E.** Add a LOOP hint to the query.

**F.** Add a FORCESEEK hint to the query.

**G.** Include a SET TRANSACTION ISOLATION LEVEL SERIALIZABLE statement before you run the query.

**H.** Enable the optimize for ad hoc workloads option.
