NEW QUESTION: 1

Lydia needs to create a set of CRUD services for a database table. The columns that must be retrieved from the database are a subset of those defined for the table. What is the most efficient way for Lydia to create these services?

- A.** Use the SQL Data Services builder to generate all of the CRUD operations and explicitly specify the set of columns used for the List and Retrieve operations.
- B.** Create a SQL Call builder for each CRUD operation and use a SQL Statement override to explicitly choose those columns needed for the SELECT operation.
- C.** Use the SQL View and Form builder to define the CRUD services and automatically generate the CRUD user interface.
- D.** Use the SQL Service Definition builder and apply a Data Column Modifier to select only the desired columns.

Answer: A

NEW QUESTION: 2

Answer:

Explanation:

Explanation

* The Get-DnsServerStatistics cmdlet retrieves statistics of a Domain Name System (DNS) server. If the ZoneName parameter is specified, this cmdlet gets statistics for the zones specified by that parameter.

* To help network administrators migrate to DNS for all name resolution, the DNS Server role in Windows Server 2008 (and later) supports a specially named zone, called GlobalNames. By deploying a zone with this name, you can have the static, global records with single-label names, without relying on WINS. These single-label names typically refer to records for important, well-known and widely-used servers-servers that are already assigned static IP addresses and that are currently managed by IT-administrators using WINS.

NEW QUESTION: 3

You work in a company which uses SQL Server 2008. You are the administrator of the company database.

Now you are in charge of a SQL Server 2008 Enterprise Edition instance.

There is a database named DB1 in the instance. A backup of DB1 is performed every day. You have to

minimize the size of the full database backup files of DB1. In the options below, which Transact-SQL statement should you use?

- A.** BACKUP DATABASE DB1 TO DISK = 't:backupsdb1.bak' WITH DIFFERENTIAL;
- B.** BACKUP DATABASE DB1 TO DISK = 't:backupsdb1.bak' WITH COMPRESSION;
- C.** BACKUP DATABASE DB1 TO DISK = 't:backupsdb1.bak' WITH COMPRESSION, DIFFERENTIAL;
- D.** BACKUP DATABASE DB1 TO DISK = 't:backupsdb1.bak';

Answer: B

Explanation:

We will use the compression option to minimize the FULL backup size. So, answer D is giving us one differential backup COMPRESSION: Backup compression was introduced in SQL Server 2008 Enterprise. This topic discusses the basics of backup compression, including the performance trade-off of compressing backups.

Note:

Though creating compressed backups is supported only in SQL Server 2008 Enterprise and later, every SQL Server 2008 or later edition can restore a compressed backup.

Restrictions

The following restrictions apply to compressed backups:

Compressed and uncompressed backups cannot co-exist in a media set.

Previous versions of SQL Server cannot read compressed backups.

NTbackups cannot share a tape with compressed SQL Server backups.
