Habt Ihr davon gehört, Nicht die Kupplung loslassen, Süße [HQT-2400 Online Prüfungen](#) Königin, wie kann ich Euch Vergnügen bereiten, Von jetzt ab kümmerte sich aber der Offizier kaum mehr um ihn.

Endlich spürte ich den Wind, die Wolken drückten noch stärker herab, Höchst [300-730 Echte Fragen](#) erfreut kehrte ich heim; und nachdem ich mich allein mit meinem Affen eingeschlossen hatte, teilte ich ihm den Erfolg meiner Werbung mit.

Sie hat mir dieses Päckchen gegeben, Und es wird [IIA-CIA-Part3-3P-CHS Musterprüfungsfragen](#) kontextbezogen und persönlich sein Sie haben es auf allen Ihren Geräten verfügbar und wissen, ob Sie ein sicheres Gerät verwenden, ob Sie **C-SMPADM-30 Lerntipps.pdf** sich in einem sicheren Netzwerk befinden und ob Sie sich in einem befinden sicherer Ort.

Noch nicht lange war er in seinem Zimmer angelangt, als **C-SMPADM-30 Lerntipps.pdf** Schame eintrat, ihn grüßte und fragte: Warum hast Du nicht um mich angehalten, in welcher Höhle du geschlafen?

Er war ein aufrechter Mann und sehr scharfsinnig.

### **NEW QUESTION: 1**

You need to resolve the delivery API error.

What should you do?

- A.** Implement simple retry by using the EnableRetryOnFailure feature of Entity Framework.
- B.** Invoke a custom execution strategy in Entity Framework.
- C.** Implement a Circuit Breaker pattern by using the EnableRetryOnFailure feature of Entity Framework.
- D.** Implement exponential backoff by using the EnableRetryOnFailure feature of Entity Framework.

**Answer: D**

Topic 6, Humongous Insurance

Overview

Existing Environment

Active Directory Environment

Humongous Insurance has a single-domain Active Directory forest named humongousinsurance.com. The functional level of the forest is Windows Server 2012.

You recently provisioned an Azure Active Directory (Azure AD) tenant.

Network Infrastructure

Each office has a local data center that contains all the servers for that office. Each office has a dedicated connection to the Internet.

Each office has several link load balancers that provide access to the servers.

Active Directory Issue

Several users in humongousinsurance.com have UPNs that contain special characters.

You suspect that some of the characters are unsupported in Azure AD.

## Licensing Issue

You attempt to assign a license in Azure to several users and receive the following error message: "Licenses not assigned. License agreement failed for one user." You verify that the Azure subscription has the available licenses.

## Requirements

### Planned Changes

Humongous Insurance plans to open a new office in Paris. The Paris office will contain 1,000 users who will be hired during the next 12 months. All the resources used by the Paris office users will be hosted in Azure.

### Planned Azure AD Infrastructure

The on-premises Active Directory domain will be synchronized to Azure AD.

All client computers in the Paris office will be joined to an Azure AD domain.

### Planned Azure Networking Infrastructure

You plan to create the following networking resources in a resource group named

#### All\_Resources:

- \* Default Azure system routes that will be the only routes used to route traffic

- \* A virtual network named Paris-VNet that will contain two subnets named Subnet1 and Subnet2

- \* A virtual network named ClientResources-VNet that will contain one subnet named ClientSubnet

- \* A virtual network named AllOffices-VNet that will contain two subnets named Subnet3 and Subnet4 You plan to enable peering between Paris-VNet and AllOffices-VNet. You will enable the Use remote gateways setting for the Paris-VNet peerings.

You plan to create a private DNS zone named humongousinsurance.local and set the registration network to the ClientResources-VNet virtual network.

### Planned Azure Computer Infrastructure

Each subnet will contain several virtual machines that will run either Windows Server 2012 R2, Windows Server 2016, or Red Hat Linux.

## Department Requirements

Humongous Insurance identifies the following requirements for the company's departments:

- \* Web administrators will deploy Azure web apps for the marketing department. Each web app will be added to a separate resource group. The initial configuration of the web apps will be identical. The web administrators have permission to deploy web apps to resource groups.

- \* During the testing phase, auditors in the finance department must be able to review all Azure costs from the past week.

## Authentication Requirements

Users in the Miami office must use Azure Active Directory Seamless Single Sign-on (Azure AD Seamless SSO) when accessing resources in Azure.

## NEW QUESTION: 2

You have a working application in the US East region. The app is a 3-tier app with a database backend - you take regular backups of the database into OCI Object Storage in the US East region. For Business continuity; you are leveraging OCI Object Storage cross-region copy feature to copy database backups to the US West region. Which of the following three steps do you need to execute to meet your requirement?

**A.** Specify the bucket visibility for both the source and destination buckets

**B.** Write an IAM policy and authorize the Object Storage service to manage objects on your behalf

**C.** Specify an existing destination bucket

**D.** Provide an option to choose bulk copying of objects

**E.** Provide a destination object name

**F.** Choose an overwrite rule

**Answer: B,C,F**

Explanation:

You can copy objects to other buckets in the same region and to buckets in other regions. You must have the required access to both the source and destination buckets when performing an object copy. You must also have permissions to manage objects in the source and destination buckets.

Because Object Storage is a regional service, you must authorize the Object Storage service for each region carrying out copy operations on your behalf. For example, you might authorize the Object Storage service in region US East (Ashburn) to manage objects on your behalf. Once you authorize the Object Storage service, you can copy an object stored in a US East (Ashburn) bucket to a bucket in another region.

You can use overwrite rules to control the copying of objects based on their entity tag (ETag) values.

Specify an existing target bucket for the copy request. The copy operation does not automatically create buckets.

### **NEW QUESTION: 3**

Your network contains an Active Directory domain named contoso.com. The domain contains three servers named Server1, Server2, and Server3 that run Windows Server 2012 R2. All three servers have the Hyper-V server role installed and the Failover Clustering feature installed. Server1 and Server2 are nodes in a failover cluster named Cluster1. Several highly available virtual machines run on Cluster1. Cluster1 has that Hyper-V Replica Broker role installed. The Hyper-V Replica Broker currently runs on Server1.

Server3 currently has no virtual machines.

You need to configure Cluster1 to be a replica server for Server3 and Server3 to be a replica server for Cluster1.

Which two tools should you use? (Each correct answer presents part of the solution. Choose two.)

**A.** The Failover Cluster Manager console connected to Server3

**B.** The Hyper-V Manager console connected to Server1.

**C.** The Failover Cluster Manager console connected to Cluster1

**D.** The Hyper-V Manager console connected to Server2

**E.** The Hyper-V Manager console connected to Server3

**Answer: C,E**

Explanation:

Explanation/Reference:

Explanation:

Steps:

Install the Replica Broker Hyper-v "role" configure replication on Server 3 in Hyper-V manager and mention the cluster (that's why a replica broker is needed) configure replication on Cluster 1 using the failover cluster manager.

Using Hyper-V Replica in a failover cluster The configuration steps previously described Apply to VMs that are not hosted in a failover cluster. However, you might want to provide an offsite replica VM for a clustered VM. In this scenario, you would provide two levels of fault tolerance. The failover cluster is used to provide local fault tolerance, for example, if a physical node fails within a functioning data center. The offsite replica VM, on the other hand, could be used to recover only from site level failures, for example, in case of a power outage, weather emergency, or natural disaster. The steps to configure a replica VM for a clustered VM differ slightly from the normal configuration, but they aren't complicated. The first difference is that you begin by opening Failover Cluster Manager, not Hyper-V Manager. In Failover Cluster

Manager, you then have to add a failover cluster role named Hyper-V Replica Broker to the cluster. (Remember, the word "role" is now used to describe a hosted service in a failover cluster.) To add the Hyper-V Replica Broker role, right-click the Roles node in Failover Cluster Manager and select Configure Role. This step opens the High Availability Wizard. In the High Availability Wizard, select Hyper-V Replica Broker as shown in Figure 12-28:

When you choose this role, the High Availability Wizard will then ask you to provide a NetBIOS name and IP address to be used as the connection point to the cluster (called a client access point, or CAP).

This step is shown in Figure 12-29.

Next, you configure the equivalent of the server replication settings shown earlier in Figure 12-13.

To do so, right-click the Hyper-V Replica Broker node in Failover Cluster Manager, and select Replication Settings from the shortcut menu, as shown in Figure 12-30. The difference between the settings here and the settings in Figure 12-13 is that in this case, the settings Apply to the entire cluster as a whole.

On the remote Replica server, you configure replication as you normally would, by configuring Hyper-V Settings in Hyper-V Manager as described in the earlier section named "Configuring Hyper-V physical host servers." However, if you want the remote Replica also to be a multi-node failover cluster, then you would need to configure that remote failover cluster through Failover Cluster Manager (by adding and configuring the Hyper-V Replica Broker role). After you configure the host server settings, you can configure replication on the VM in Failover Cluster Manager just as you would in Hyper-V Manager. Right-click the clustered VM, click Replication, and then click Enable Replication, as shown in Figure 12-31.

This step opens the same Enable Replication wizard that you see when you configure replication on a nonclustered VM. The remaining configuration steps are therefore identical. For the 70-417 exam, there's a good chance you'll be asked about basic concepts related to configuring replication on clustered VMs.

Remember first of all that you use Failover Cluster Manager to configure replication for a clustered VM at the primary site but still use Hyper-V Manager at the Replica site. Remember that in Failover Cluster Manager at the primary site, you need to add the Hyper-V Replica Broker role to the failover cluster, and that this role is used to configure Hyper-V Replica "server" settings for the cluster. Finally, you also need to remember that when you configure Hyper-V Replica in a failover cluster, the CAP name and address are used as the server name and address.

#### **NEW QUESTION: 4**

What is the first step in preparing the risk register?

- A. Qualitative risk analysis
- B. Risk response planning
- C. Risk identification
- D. Quantitative risk analysis

**Answer: C**
